

Task 1. Will the conversion to BCNF be dependency preserving in any case? Proof your statement and give a reasoning for choosing BCNF design.

A relation schema R is in BCNF with respect to a set F of functional dependencies if for all functional dependencies in F^+ of the form

$$\alpha \rightarrow \beta$$

where $\alpha \subseteq R$ and $\beta \subseteq R$, at least one of the following holds:

$$\alpha \rightarrow \beta \text{ is trivial (i.e., } \beta \subseteq \alpha \text{)}$$

α is a superkey for R

It is not always possible to achieve both BCNF and dependency preservation.

Consider a schema:

dept_advisor(s_ID, i_ID, department_name)

With function dependencies:

$$i_ID \rightarrow dept_name$$

$$s_ID, dept_name \rightarrow i_ID$$

dept_advisor is not in BCNF

i_ID is not a superkey.

Any decomposition of dept_advisor will not include all the attributes in

$$s_ID, dept_name \rightarrow i_ID$$

Thus, the decomposition is NOT be dependency preserving

Task 2. Given table in 1NF, convert to 3NF if PK is {UnitID, StudentID}:

UnitID	StudentID	Date	Tutor ID	Topic	Room	Grade	Book	TutEmail
U1	St1	23.02.03	Tut1	GMT	629	4.7	Deumlich	tut1@fhbb.ch
U2	St1	18.11.02	Tut3	Gln	631	5.1	Zehnder	tut3@fhbb.ch
U1	St4	23.02.03	Tut1	GMT	629	4.3	Deumlich	tut1@fhbb.ch
U5	St2	05.05.03	Tut3	PhF	632	4.9	Dümmers	tut3@fhbb.ch
U4	St2	04.07.03	Tut5	AVQ	621	5.0	SwissTopo	tut5@fhbb.ch

Transitive dependency:

TutorID -> TutEmail;

Topic -> Room;

Topic -> Book;

Topic -> Grade;

Topic -> Date;

Student_parameters	
PK	UnitID
PK	StudentID
FK	Topic
FK	TutorID

Exam_parameters	
PK	Topic
	Room
	Book
	Grade
	Date

Tutor_contacts	
	TutorID
	TutEmail

Task 3. Given table in 1NF, convert to 2NF if PK is {ProjectName, ProjectManager}, use decomposition:

ProjectName	ProjectManager	Position	Budget	TeamSize
Project1	Manager1	CTO	1 kk \$	15
Project2	Manager2	CTO2	1.5 kk \$	12

ProjectName -> Position;

ProjectName -> Budget;

Project	
PK	ProjectName
PK	ProjectManager
FK	ProjectID
	TeamSize

Project_parameters	
PK	ProjectID
	Position
	Budget

Task 4. Given table, convert to 3NF if PK is Group, use decomposition:

Faculties have a number of specialities, each speciality consists of a set of particular groups.

Group	Faculty	Speciality
g1	f1	s1
g2	f2	s2

Group_spec	
PK	<u>Group</u>
FK	Speciality

Spec_fac	
PK	<u>Speciality</u>
	Faculty

Task 5. Given table, convert to BCNF if PK is {ProjectID, Department}, use decomposition:

Curator depends on projectID and related departments, teamSize directly relates to project and related departments, ProjectGroupsNumber depends on TeamSize.

ProjectID	Department	Curator	TeamSize	ProjectGroupsNumber
p1	d1	e1	100	5
p2	d2	e2	120	6

ProjectID -> Curator;

Department -> Curator;

ProjectID -> teamSize;

TeamSize -> ProjectGroupsNumber;

Project	
PK	<u>ProjectID</u>
FK	Curator
FK	TeamID

Table	
PK	<u>TeamID</u>
	TeamSize
	ProjectGroupsNumber

Table	
PK	<u>Curator</u>
	Department

Task 6. List the three design goals for relational databases, and explain why each is desirable. Give an example of both desirable and undesirable types of decompositions.

For relational databases, atomicity of data is important, uniqueness in attributes in all tables, as well as reducing the number of transitive dependencies, but primary and secondary keys are also needed to preserve logical relationships.
